

Surface - one-page brief

What your agent just put on your screen

The primitive

An agent renders live UI onto every screen you own, and every tap lands back in its context as intent. Two directions, one object.

Why a PDF is here

Not everything an agent wants to show you is markup. A PDF, an image, a video, a spreadsheet export - surface present <path> puts any of them on the display in one command, and the browser's own reader handles the rest. No conversion, no screenshotting, no upload.

Three ways in

surface create ad-hoc HTML the agent writes on the spot
surface link a file in your project, re-served live as you edit it
surface present a one-shot look at a document like this one

Say it out loud

"surface it" "put that on my surface" "show me on the display"
Your agent reads SKILL.md, so plain English is the whole interface.
